Digitisation in hearing aid acoustics – are sensors and health functions the future of hearing systems?

Michael Preuss, Stäfa (Switzerland), Basic + Advanced

In recent years, general digitisation has significantly shaped and changed the world of hearing systems. From pocket devices to the first digital hearing systems, to BT streaming and tele audiology. Hearing impaired people benefit tremendously from the current feature set of modern hearing instruments. Learn how sensor-based intelligence and health features can shape the future of hearing healthcare and find out about the opportunities this presents for the profession as a whole.
